

# fancyss Shunt Flow

Outer ingress + DNS black/white sets + xray inner shunt

## Why strict Mainland-whitelist ingress needs an outer proxy-domain set

If a flow never reaches xray, the inner shunt rule cannot match it. Enabled rules that target proxy nodes may push their domains into shunt\_proxy, which is then merged into the outer DNS / blacklist path to guarantee those flows enter xray first.

### Reading guide

1. DNS classifies domain requests into direct/proxy/default sets.
2. Outer ingress decides whether traffic reaches xray at all.
3. Inner shunt only works for traffic that already entered xray.
4. In strict Mainland-whitelist ingress, proxy-domain extraction exists only to guarantee that entry.
